

Abstract

A handheld mobile communications device includes a support structure. Radio signal processing circuitry is positioned on the support structure and is configured to receive and transmit radio signals. Audio signal processing circuitry is positioned on the support structure and is operatively connected to the radio signal processing circuitry. Image processing circuitry is positioned on the support structure and is operatively connected to the radio signal processing circuitry. A printing mechanism is detachably mountable on the support structure to be operatively connected to the image processing circuitry to print images generated by the image processing circuitry.
